MEDIA RELEASE

Going Green Just Got Greener!

Attic Breeze, LLC is proud to announce the commissioning of our new photovoltaic power system. As the final phase in construction of our Gatesville manufacturing facility, the recently installed 23 kilowatt grid-tied photovoltaic system is the largest of its kind in Coryell county. In combination with LED lighting, high-efficiency HVAC, solar powered ventilation, and other energy efficiency related construction projects, the new photovoltaic system is designed to produce enough electricity to power the entire Attic Breeze facility throughout the year.

“As a manufacturer of solar powered ventilation products, it’s a natural progression for our company to move forward with incorporating solar energy as an integral part of our manufacturing process,” comments Travis Hipp, Attic Breeze founder and president. “I believe it is important as a renewable energy focused company to do our part in conserving natural resources. Using 100% solar power to manufacture 100% solar powered products just doesn’t get any greener.”

Economic development specialists in Central Texas hope that other companies will follow Attic Breeze’s lead and find opportunities of their own to utilize solar power and energy efficiency related products.

Attic Breeze
America’s Leader in Solar Powered Ventilation
